Quantity Affected:	36 capsules (4 blister strips)
Quantity Dispensed:	12 capsules to 2 patients before defect was noticed
Storage at Pharmacy:	Air-conditioned, 22-25 C, humidity logged daily

NATURE OF COMPLAINT

A customer returned a partially used strip on 23-Jul-2026 reporting that the capsules appeared discoloured. On inspection of our remaining stock from the same batch, our pharmacist identified that a number of capsules had developed a brownish tinge on the capsule body, most visible at the join between cap and body. Several capsules also appeared slightly softened to the touch and one had partially deformed within the blister cavity.

Two of the affected blister strips showed poor seal integrity, with the foil lifting at the corner of the cavity. No visible foreign matter was observed inside any capsule. No adverse reaction has been reported by either of the two patients who received capsules from this batch, and both were contacted by telephone on 24-Jul-2026 as a precaution.

The remaining stock has been removed from the dispensing shelf and segregated. We request replacement stock and a written response confirming the outcome of your investigation.
